VCR

Mechanical Constant Volume regulator

Application

The mechanical constant volume regulator type VCR is used to reduce the cost and time of air balancing or commissioning on site. The advantage over manual dampers is that measurements and adjustments by a qualified commissioning engineer are no longer required. The factory set air volume can be read on the external scale and can be site adjusted.

When using normal manual balancing dampers, if the pressure in the duct system changes, the volume flows in the system with also changes. This is not the case when type VCR mechanical constant volume regulators are used. The regulators respond immediately and adjust the damper positions directly so that the set volume flow is held constant over the entire differential pressure range.

VCR-SW

Design features

Casing

- Ridged galvanised steel construction (1.0mm)
- Silicone bellow for anti-oscillating and reduced hysteresis.
- Spigots comply with DIN 24145 or DIN 24146 ducts.
- Maintenance free
- Short installed length
- Rubber seal (optional) for easy and air tight mounting (DIN 24194 Class 4)
- Casing leakage complies with Class II, VDI 3803 or DIN 24194, Part 2

Volume Flow Control

- Mechanical system powered, no external power supply
- Insensitive to mounting position
- Suitable for supply or extract air
- Operating temperature -20 to $+70^{\circ}\text{C}$
- Differential pressure range 50 to 1000 Pa
- Correct functioning even with unfavourable inlet and outlet flow conditions (minimum straight length of inlet duct $3.0 \times D$)
- Control blade shaft supported in bearings
- Includes anti oscillation bellow
- Large volume flow range (1 : 5)
- Volume flow adjustment and resetting via external scale, scale accuracy approx 5%
- Maintenance free

1. Min. P_{st} is the minimum static pressure drop required to operate the unit.

2. "--" sound pressure levels < NR 20.

3. NR* is the expected sound level in the room based on 7 dB room absorption and the following assumptions for downstream duct and diffuser attenuation:

125	250	500	1k	2k	4k	Hz
-4	-7	-15	-20	-25	-20	dB

Type Designation

Mounting instructions

To achieve the specified accuracy, a straight inlet of 3xD is required. If this is not possible, field adjustment may be required. NR units can be installed in any position, however the air flow is factory calibrated in a horizontal position. Different mounting positions can result in up to 10% error and field adjustment may be required.

Air flow field adjustment

The air flow setting can be adjusted by loosening the M6 nut (SW10) on the centre of the scale and rotation of the indicator to the required air volume.

The scale is both in m³/h and in l/s.

Do not forget to tighten the M6 nut after adjustment !!!
